

FEATURES

- 1uA Ultra-Low IQ into Vin Pin When No switching
- Adjustable output voltage from 3.0V to 5.1 V
- Selectable Fixed Output voltage
- Up to 94% Efficiency
- Output to Input Disconnect At Shutdown Mode
- Over Current Protection
- Over Temperature Protection
- 1.2MHz Fixed Frequency Switch
- SOT23-6 Package

GENERAL DESCRIPTION

The HE9115 device is a high efficiency synchronous boost converter with ultra-low quiescent current. It is designed for products powered by multiple types of batteries, and only consumes $1-\mu$ A quiescent current under light load condition, where high efficiency under light load condition is critical to achieve long battery life operation. It can achieve up to 75% efficiency at 20- μ A load. For 3.6V convert to 5.1V application it can also achieve up to 94% efficiency at 200-mA load.

APPLICATIONS

- MID,Tablet
- Smart Phone
- Bluetooth Applications
- Battery powered systems

It features a true-shutoff function that disconnects the output from input, during shutdown and output short-circuit conditions.

The HE9115 has fixed output voltage version with 5.1Voutput, and make sure that the FB PIN is floating, it can not connect to any devices. Over Current Protection, Over Temperature Protection, Output short Protection make the device operating safe.

Order Information

HE9115(12)3(4)5

Designator	Symbol	Description
1	А	Standard
23	Integer	Output Voltage
		(3.0~5.1) e.g:3.0V=2: 3; 3: 0
4	M6	Package:SOT23-6
P	R	RoHS / Pb Free
(5)	G	Halogen Free

ABSOLUTE MAXIMUM RATINGS

Description		Min	Max	Units
VOUT,EN,VIN,FB,SW Voltage		-0.3	6.5	V
SW to GND current		Internally Limited		Α
Storage Temperature Range		-65	+150	C
Junction Temperature		-40	150	C
Lead Temperature		260		C
ESD Rating	HBM (Human Body Mode)	20	000	V
	MM (Machine Mode)	200		V

THERMAL INFORMATION

	Description		Units
Package Thermal Resistance (θ_{JA})	SOT23-6	180	°C/W

RECOMMENDED OPERATION CONDITIONS

Description	Min	Max	Units
Operating Junction Temperature	-40	125	C
Operating Ambient Temperature	-40	85	C
Supply Input Voltage	+0.9	+5.5	V
Continuous Output Current		1	А

Note 1. Stresses beyond those listed as the above ABSOLUTED MAXIMUM RATINGS may cause permanent damage to the device. These are for stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in the RECOMMENDED OPERATION CONDITIONS section of the specifications are not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2. Devices are ESD sensitive. Handling precaution recommended.

Note 3. θ_{JA} is measured in the natural convection at $T_A=25^{\circ}C$ on a low effective thermal conductivity test board of JEDEC 51-3 thermal measurement standard.

Note 4. The device is not guaranteed to function outside its operating conditions. Important information and disclaimer:

SHININGIC reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time.

ELECTRICAL CHARACTERISTICS

HE9115 Synchronous Boost Converter with 1uA Ultra Low IQ

TYPICAL CHARACTERISTICS

TA =25°C, unless otherwise specified.

FUNCTION DESCRIPTION

Overview

The HE9115 device is a high efficiency synchronous boost converter with ultra-low quiescent current. It is designed for products powered by multiple types of batteries, and only consumes 1- μ A quiescent current under light load condition to achieve long battery life operation. It can achieve up to 75% efficiency at 20- μ A load , For 3.6V to 5.1V application it can also achieve up to 94% efficiency at 200-mA load. It features a true-shutoff function that disconnects the input and output during shutdown and output short-circuit conditions so as to minimize the leakage current.

There are two ways to set the output voltage of HE9115. For the fixed output voltage version, it can output 3.0v/3.3v/3.6v/5.1v. For the adjustable output voltage version, the programmable output voltage is provided by adjusting the external resistance voltage divider R₁ and R₂, which can be calculated by the following formula.

VOUT =
$$1.15V \times (1 + \frac{R1}{R2})$$

The adjustable version suggests using 1% or higher precision resistors to improve output voltage accuracy, smaller R_2 to improve noise resistance, and larger R_2 to reduce leakage current through the feedback resistor, thereby improving the no-load efficiency of the device. In this case, R_2 recommendes using 1M resistance, which is more susceptible to noise if the resistance is too high. It is recommended to use an external feed capacitor (C1) in parallel with R_1 to improve device stability.

Controller Operation

The EN pin is pulled to high voltage, the HE9115 is enabled. When the EN pin is pulled to low voltage, it goes into shutdown mode. In shutdown mode, the device stops switching and the rectifying PMOS fully turns off, providing the completed disconnection between input and output.

The HE9115 boost converter is controlled by current mode and voltage mode. This controller regulates the output voltage by keeping the inductor ripple current constant in the range, and adjusting the offset of this inductor current depending on the output load. If the required average input current is lower than the average inductor current defined by this constant ripple, the inductor current goes discontinuously to keep the efficiency high under light load condition. If the load current is reduced further, the boost converter will ramp up the output voltage, once the output voltage exceeds a setting threshold, the device stops switching and goes into a sleep status. In sleep status, the device consumes less quiescent current. When the output voltage is below the setting threshold it resumes switching. To achieve high efficiency, the power stage is realized as a synchronous boost topology. The output voltage VOUT is monitored via an external or internal feedback network which is connected to the voltage error amplifier. The voltage error amplifier compares this feedback voltage to the internal voltage reference to regulate the output voltage.

Soft-Start

After the EN pin is tied to high voltage, the HE9115 begins to startup. When the output voltage is charged above approximately 2.0V, the device starts the current mode operation. After VOUT reaches the target value, soft start stage ends and the peak current is now determined by the output of an internal error amplifier which compares the feedback of the output voltage and the internal reference voltage.

Under-Voltage Lockout

An under-voltage lockout (UVLO) circuit stops the operation of the converter when the input voltage drops below the typical UVLO threshold of 0.6 V. A hysteresis of 200 mV is added so that the device cannot be enabled again until the input voltage goes up to 0.8 V. This function is implemented in order to prevent malfunctioning of the device when the input voltage is between 0.6 V and 0.8 V.

Enable and Disable

When the input voltage is above UVLO rising threshold and the EN pin is pulled to high voltage, the HE9115 is enabled. When the EN pin is pulled to low voltage, the HE9115 goes into shutdown mode. In shutdown mode, the device stops switching and the rectifying PMOS fully turns off, providing the completed disconnection between input and output. Less than 0.32-µA input current is consumed in shutdown mode.

Current Limit Operation

If the inductor peak current reaches the current limit threshold I-LIM, the main switch turns off so as to stop further increase of the input current. In this case the output voltage will decrease until the power balance between input and output is achieved.

Output Short-to-Ground Protection

The HE9115 starts to limit the switch current to 200 mA when the output voltage is below target voltage. If short-to-ground condition occurs, switch current is limited at 200 mA. Once the short circuit is released, the HE9115 goes back to soft start again and regulates the output voltage.

Thermal Shutdown

The HE9115 has a built-in temperature sensor which monitors the internal junction temperature in boost mode operation. If the junction temperature exceeds the threshold 165°C, the device stops operating. As soon as the junction temperature drops below the shutdown temperature minus the hysteresis, typically 130°C, it starts operating again.
